

Charles Drew House

Charles Drew House uses a gas fired steam boiler to heat the 1st and 2nd floors. The boiler has a heat exchanger which heats water to provide heat for the 3rd floor. The temperature of the 1st and 2nd floors rooms is controlled by turning the dial on the thermostat which is located in the first floor common area to the desired setting. The temperature of the 3rd floor rooms is controlled by a thermostat that is located in the hallway on the 3rd floor. Please note that the heaters in each room can not be blocked by beds, desks, etc. They need airflow for proper heat operation.
