

## *Cohan Dormitory*

Cohan Dormitory uses gas fired hot water boilers to heat the building. The hot water that is produced by the boilers is then circulated through baseboard radiation throughout the building. Each room has its own control valve that is located inside the cover of the baseboard. The temperature of the rooms is controlled by turning the top of the control valve to the desired setting. Please note that the baseboard can not be blocked by beds, desks, etc. They need airflow for proper heat operation.
