

## *Plimpton House*

Plimpton House uses oil fired hot water boilers to heat the building. The hot water that is produced by the boilers is then circulated throughout the building. Each dorm room has a control valve located inside the baseboard cover that controls the flow of hot water through the baseboard radiation. The temperature of the room is controlled by turning the top of the control valve to the desired setting. Please note that the baseboard can not be blocked by beds, desks, etc. They need airflow for proper heat operation.
