

## *Tyler House*

Tyler House uses oil fired hot water boilers to heat the building. The hot water that is produced by the boilers is then circulated throughout the building. Each dorm room has a wall mounted thermostat that operates a valve which controls the flow of hot water through the baseboard radiation. The temperature of the room is controlled by turning the dial on the thermostat to the desired setting. The dial should be turned clockwise for less heat and counterclockwise for more heat. Please note that the baseboard can not be blocked by beds, desks, etc. They need airflow for proper heat operation.
