

## ***VALENTINE HALL***

Valentine Hall uses steam generated by the steam plant to heat the building. The steam flows through radiators located in each room. Each dorm room has its own thermostat that operates a valve which controls the flow of steam through the radiator. The temperature of the room is controlled by turning the dial on the thermostat to the desired setting. The dial should be turned clockwise for less heat, counterclockwise for more heat. Please note that the radiators can not be blocked by beds, desks, etc. They need airflow for proper heat operation.
