

mid-ocean ridge

Symmetrical magnetic
field intensity

mid-ocean ridge

Magnetic highs are positive anomalies

Magnetic lows are negative anomalies

Magnetic anomalies make a striped pattern on the ocean floor.

The stripes are parallel to mid-ocean ridges and the stripe widths are symmetrical across the ridge

mid-ocean ridge

**Ocean floor becomes a
tape recorder- recording
magnetic reversals AND
sea-floor spreading**

Sea-floor magnetic anomalies
create a **VERY PRECISE**
absolute time scale the

**MAGNETIC REVERSAL
TIME SCALE**

Good for as long as we have
ocean floor
....approx. the past 200 Ma

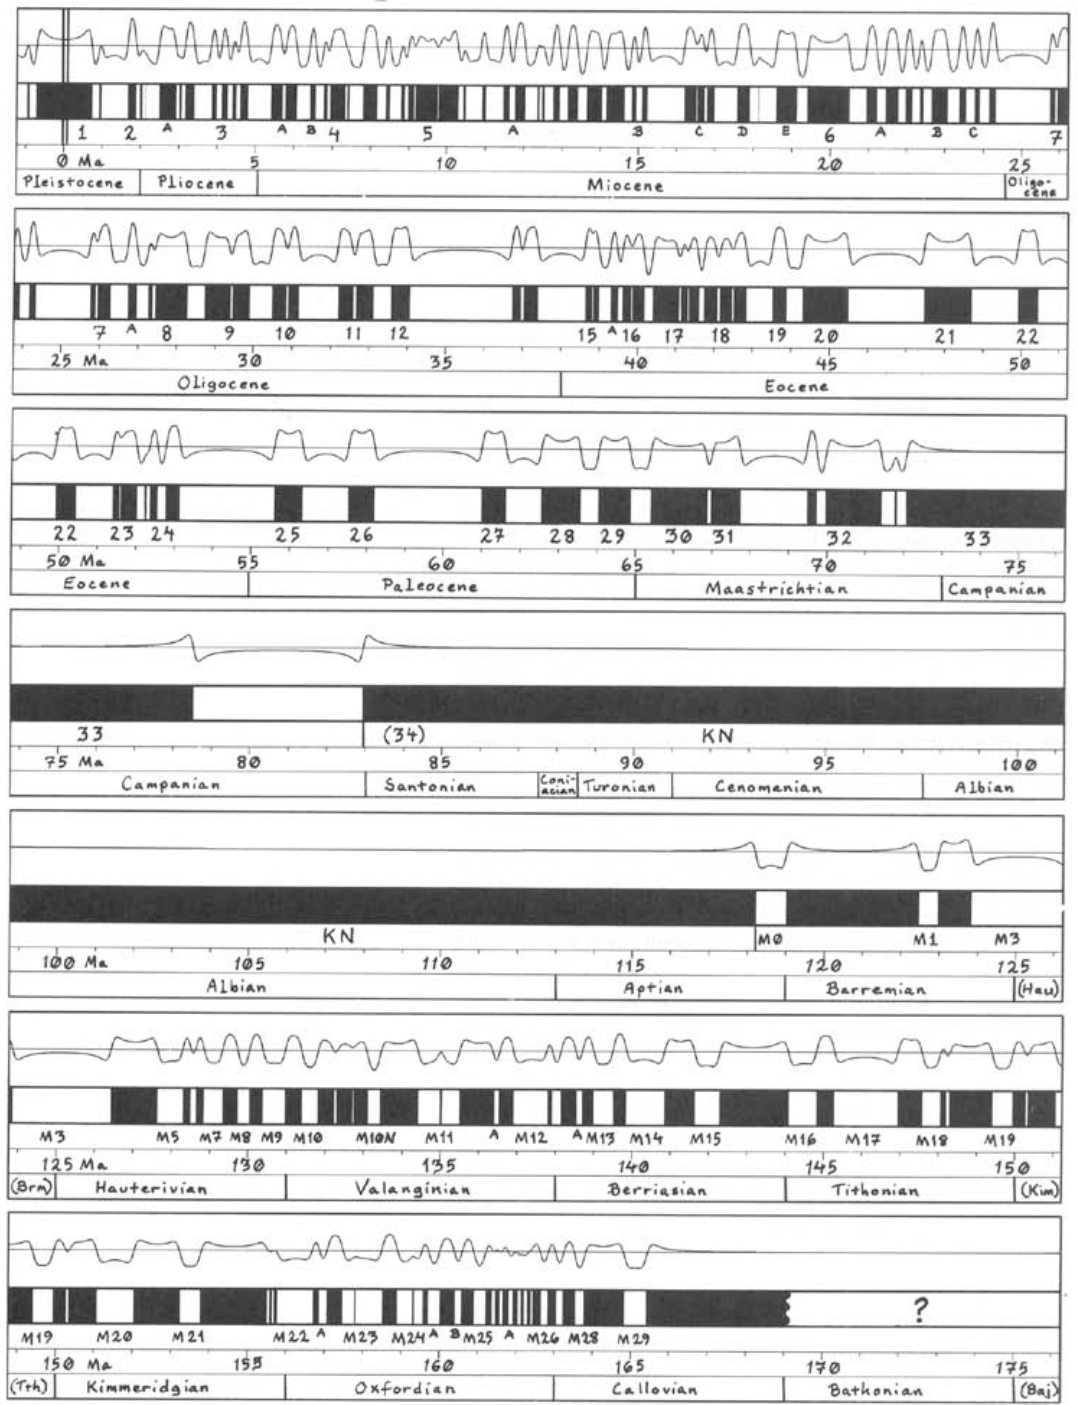

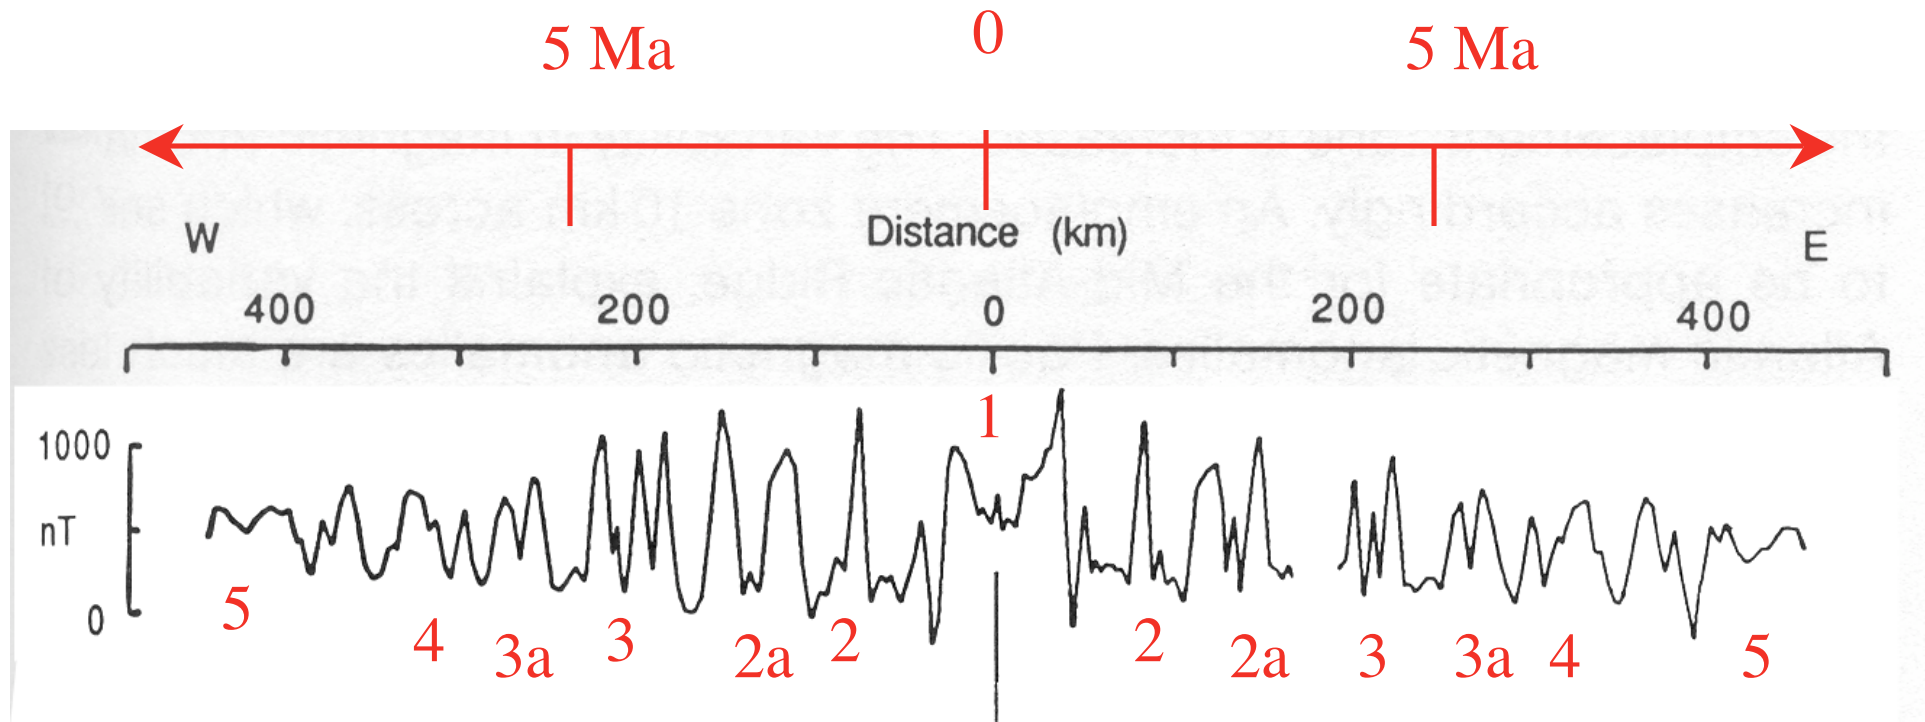

Figure 8-9.

Based on anomaly shape, magnetic anomalies can be correlated across ocean basins

From anomaly spacing, spreading rates can be determined

Mid-Atlantic ridge

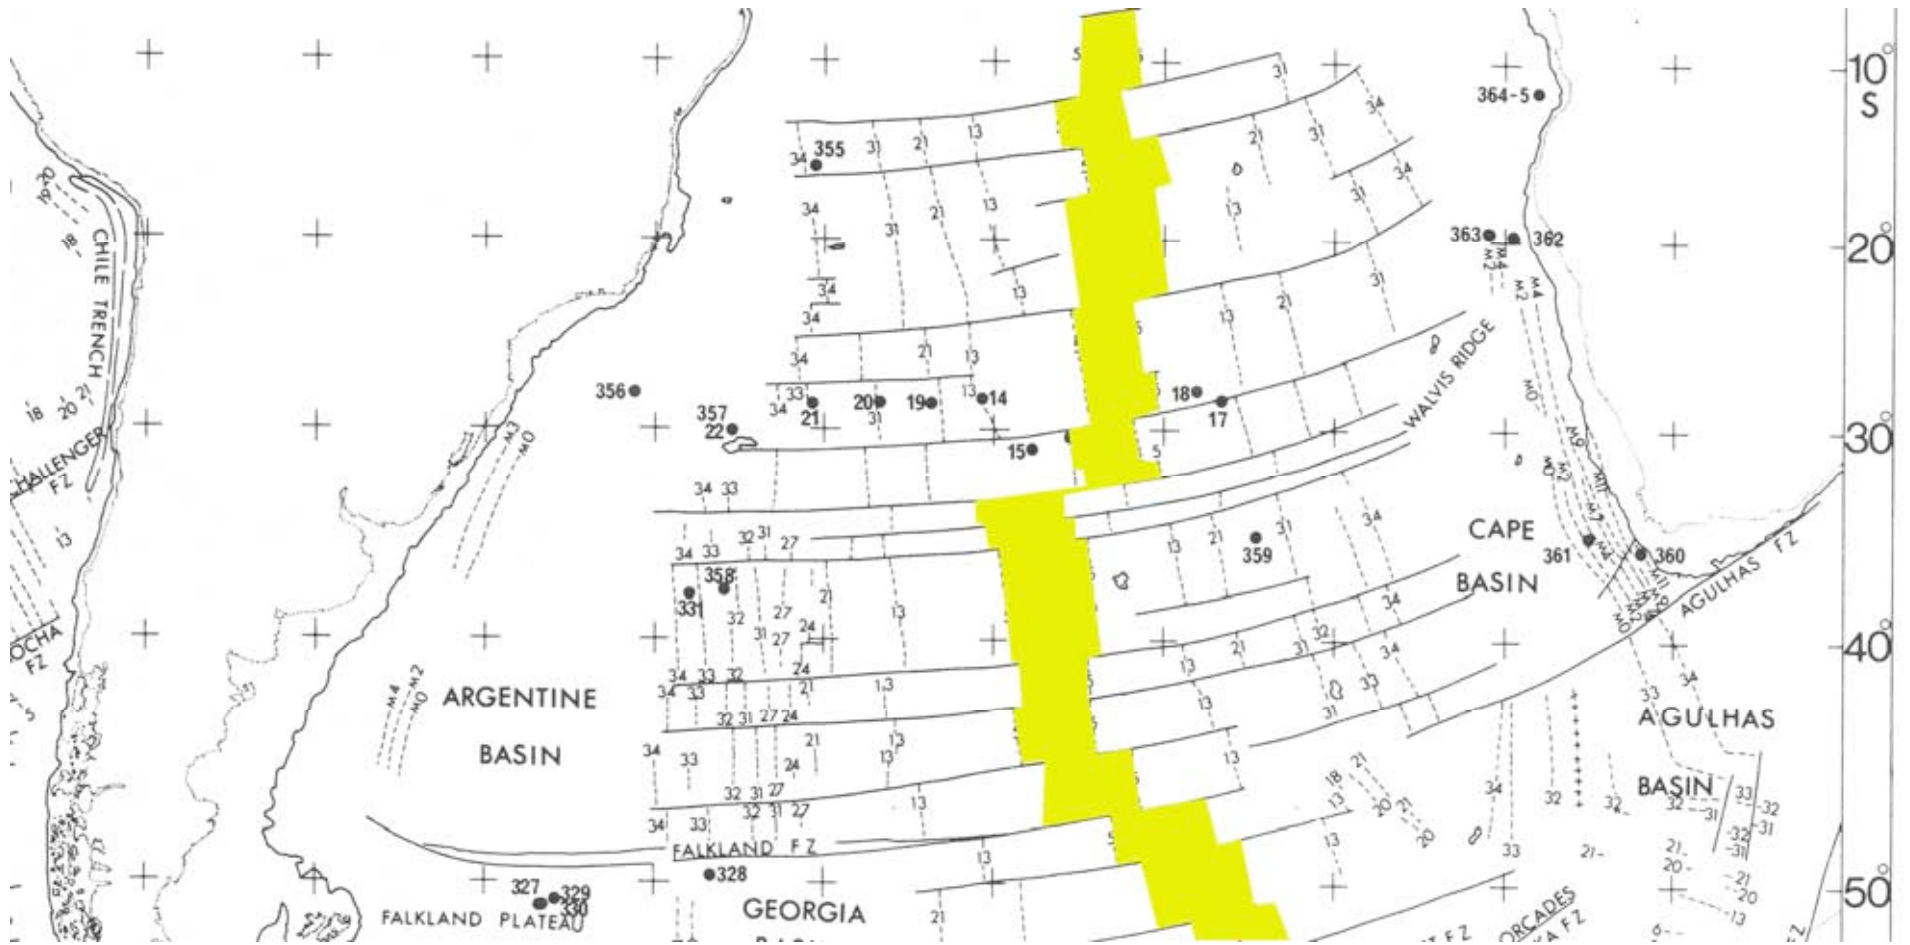

ridge axis

$$\begin{aligned}\text{Spreading rate} &= 225 \text{ km} / 5 \text{ Ma} \\ &= 45 \text{ km/Ma} \\ &= 4.5 \text{ cm/yr}\end{aligned}$$

South Atlantic magnetic anomalies

Sea floor younger than anomaly 5 (< 10 Ma)

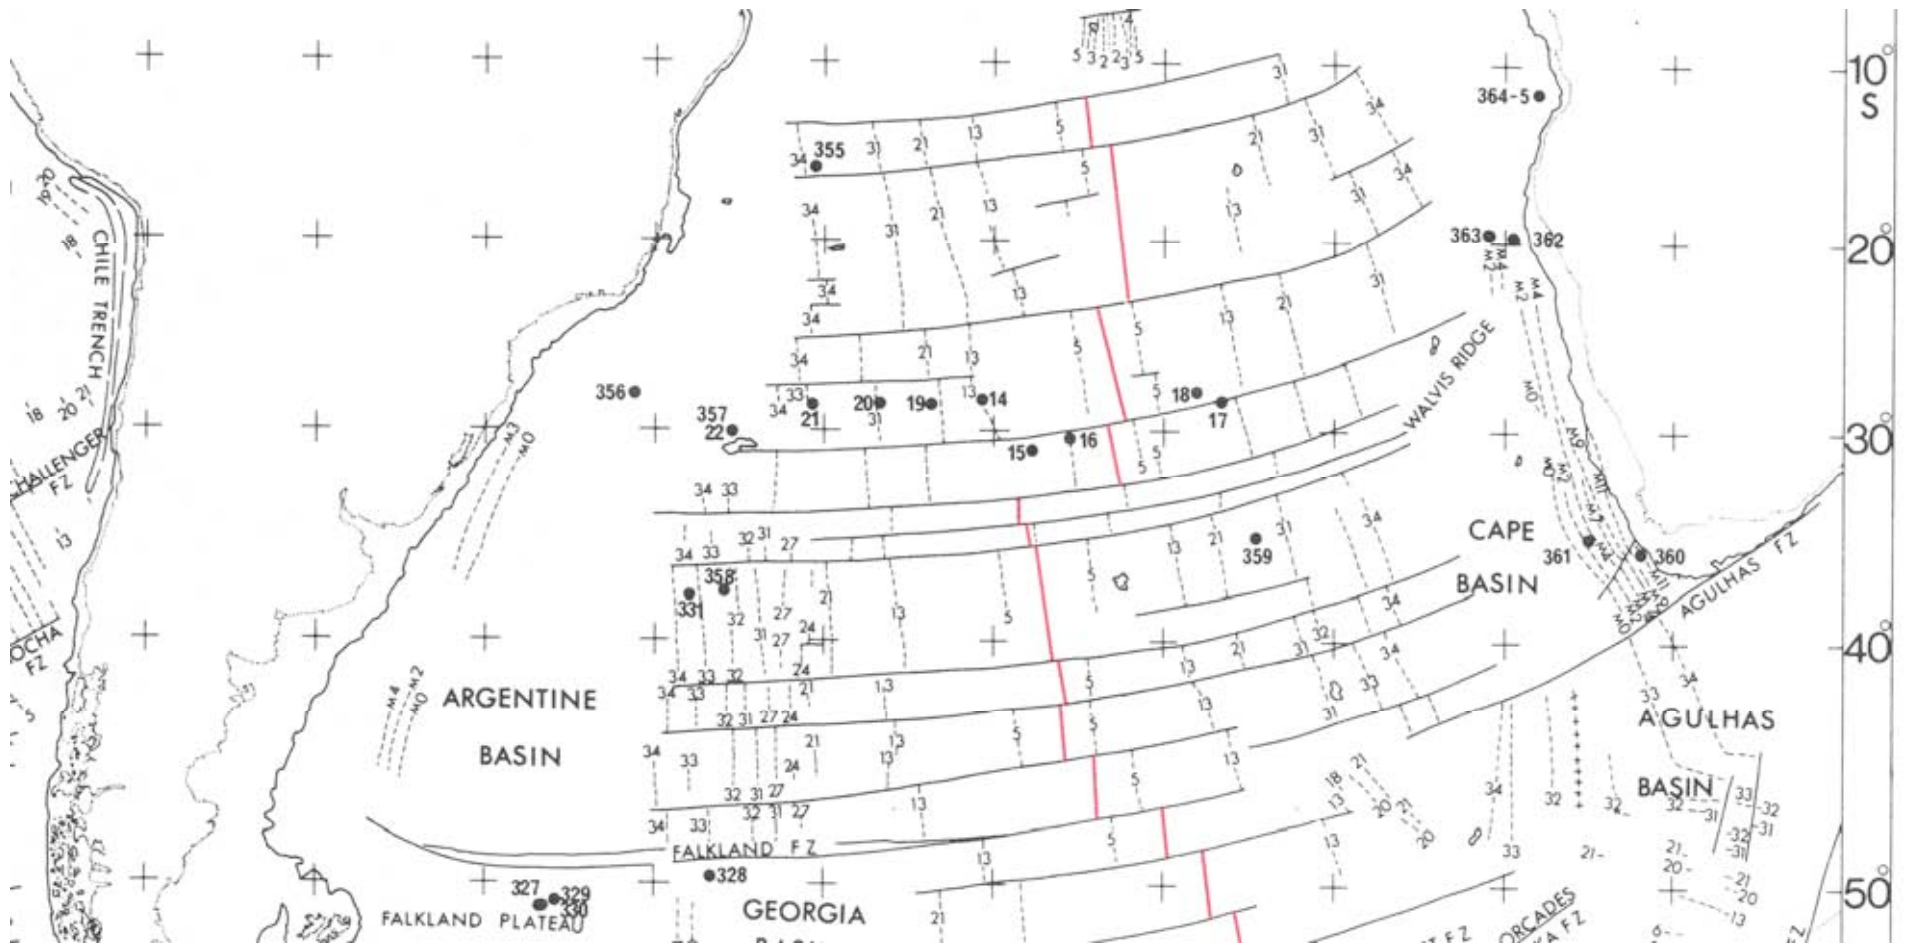

Sea floor younger than anomaly 21 (< 50 Ma)

Sea floor younger than anomaly 34 (< 90 Ma)

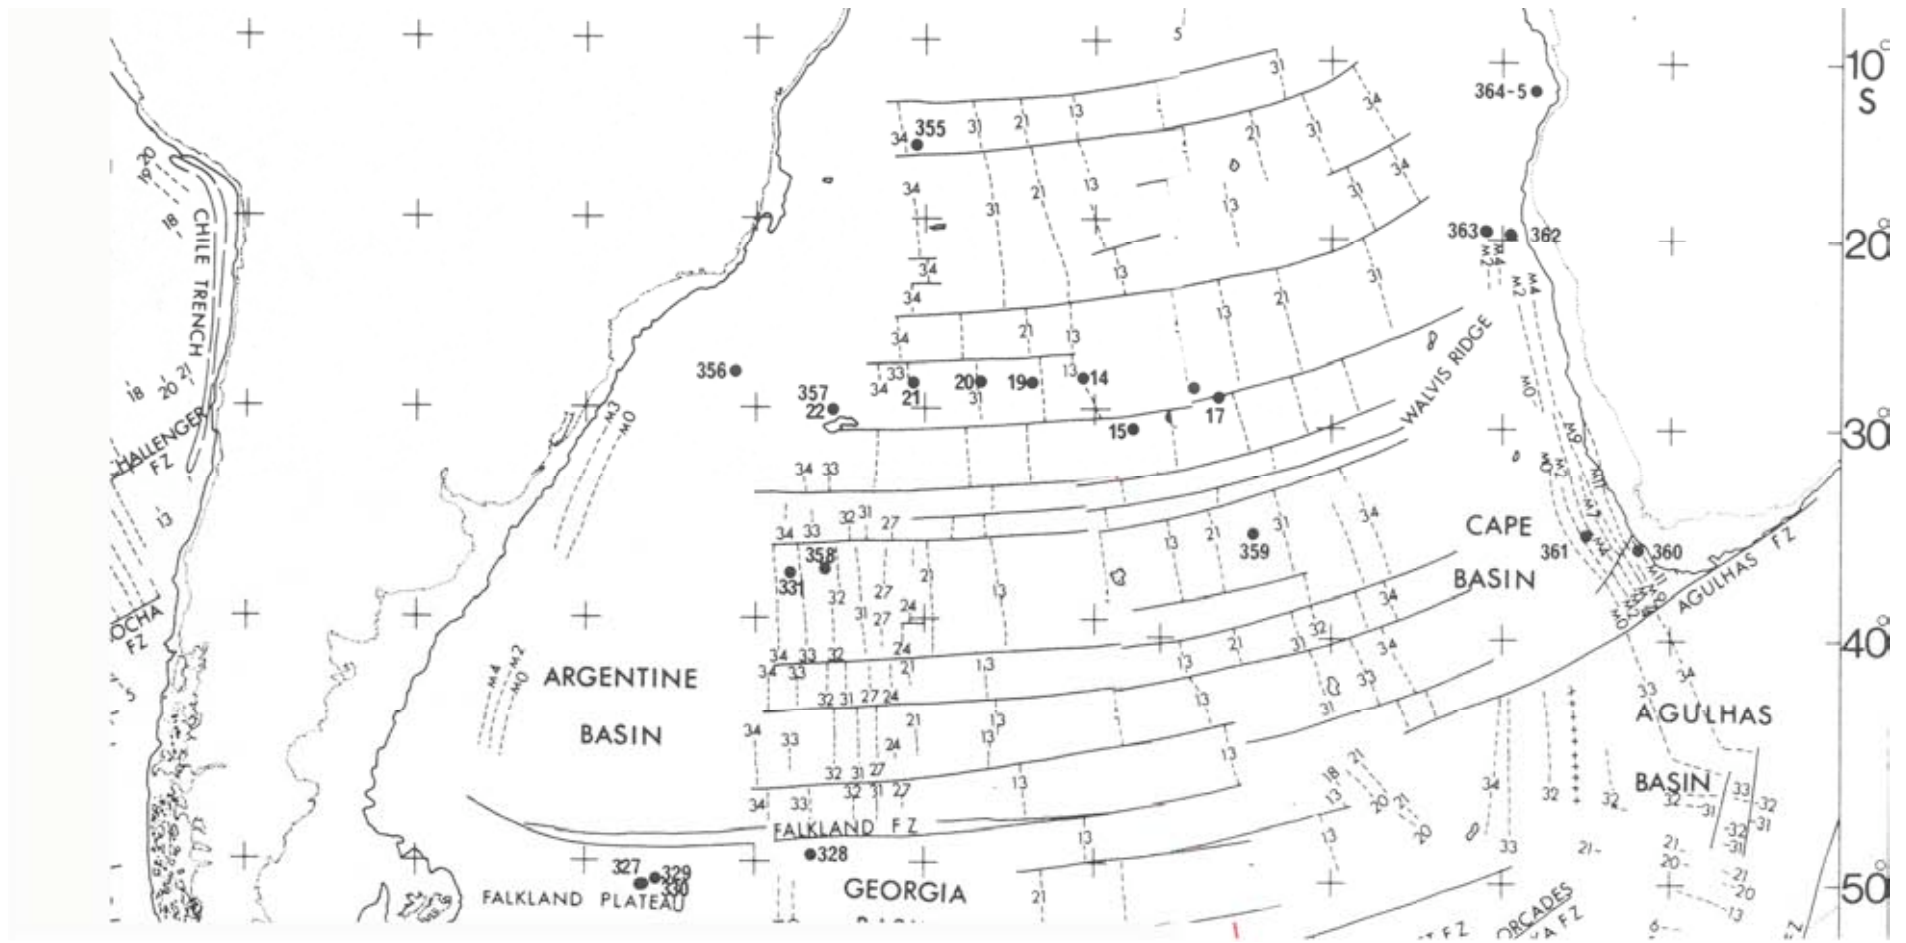

South Atlantic magnetic anomalies

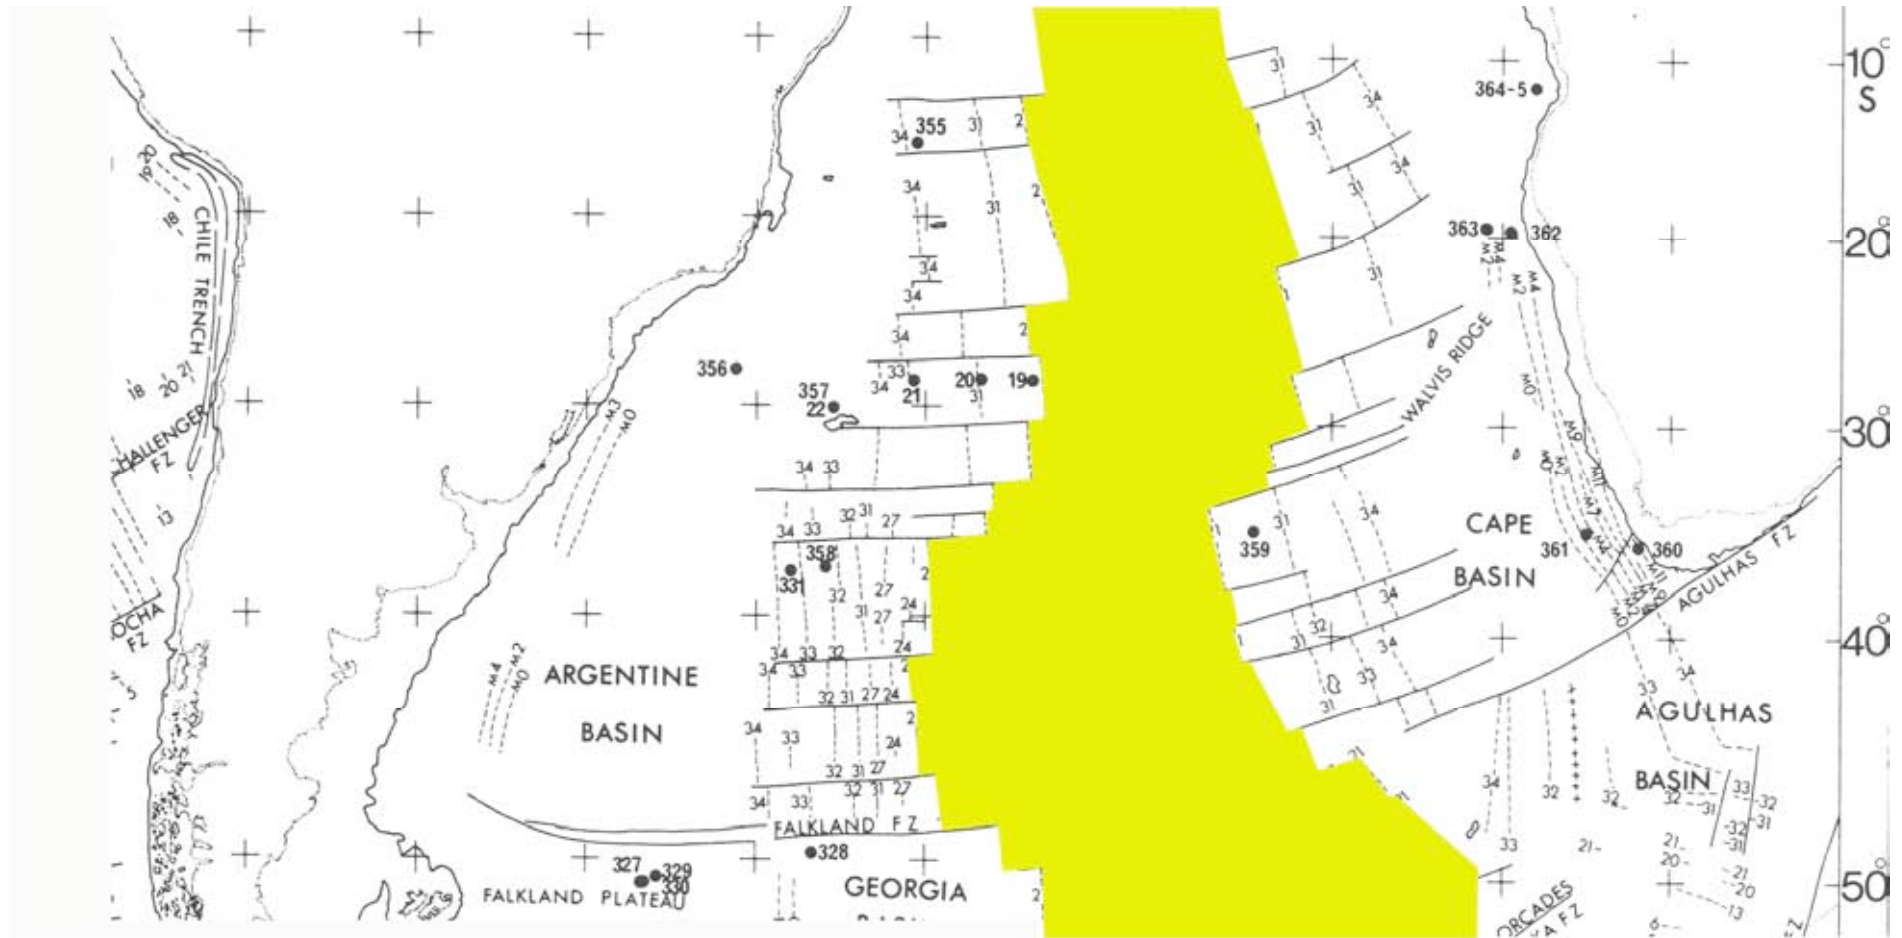

Sea floor younger than anomaly 5 (< 10 Ma)

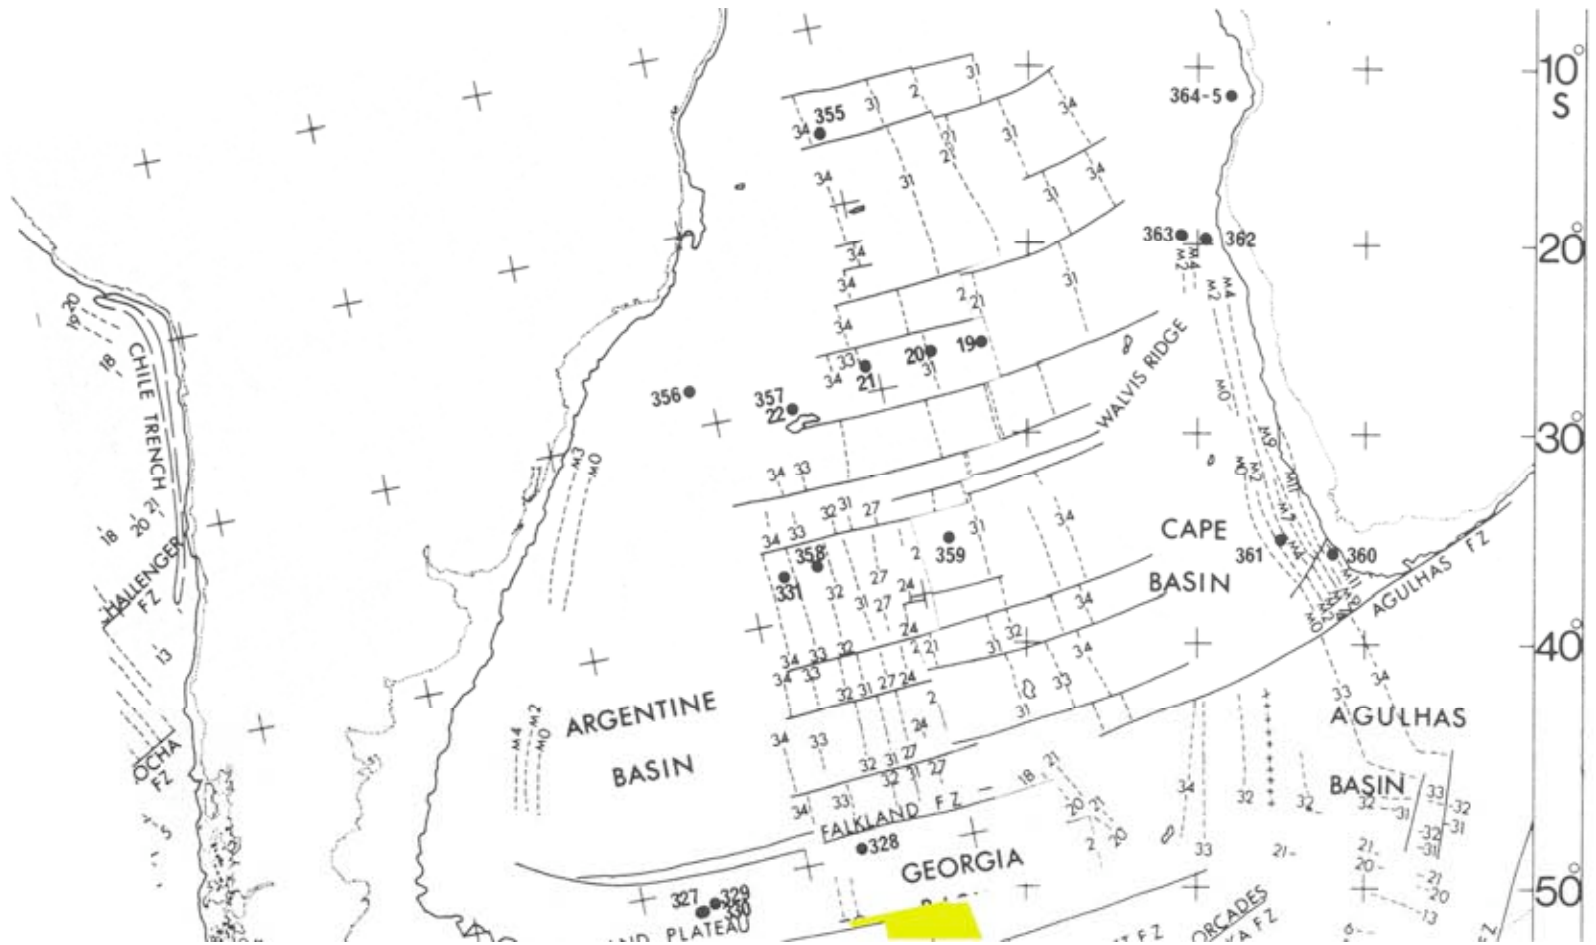

Anomaly 5 (10 Ma) reconstruction

Sea floor younger than anomaly 21 (< 50 Ma)

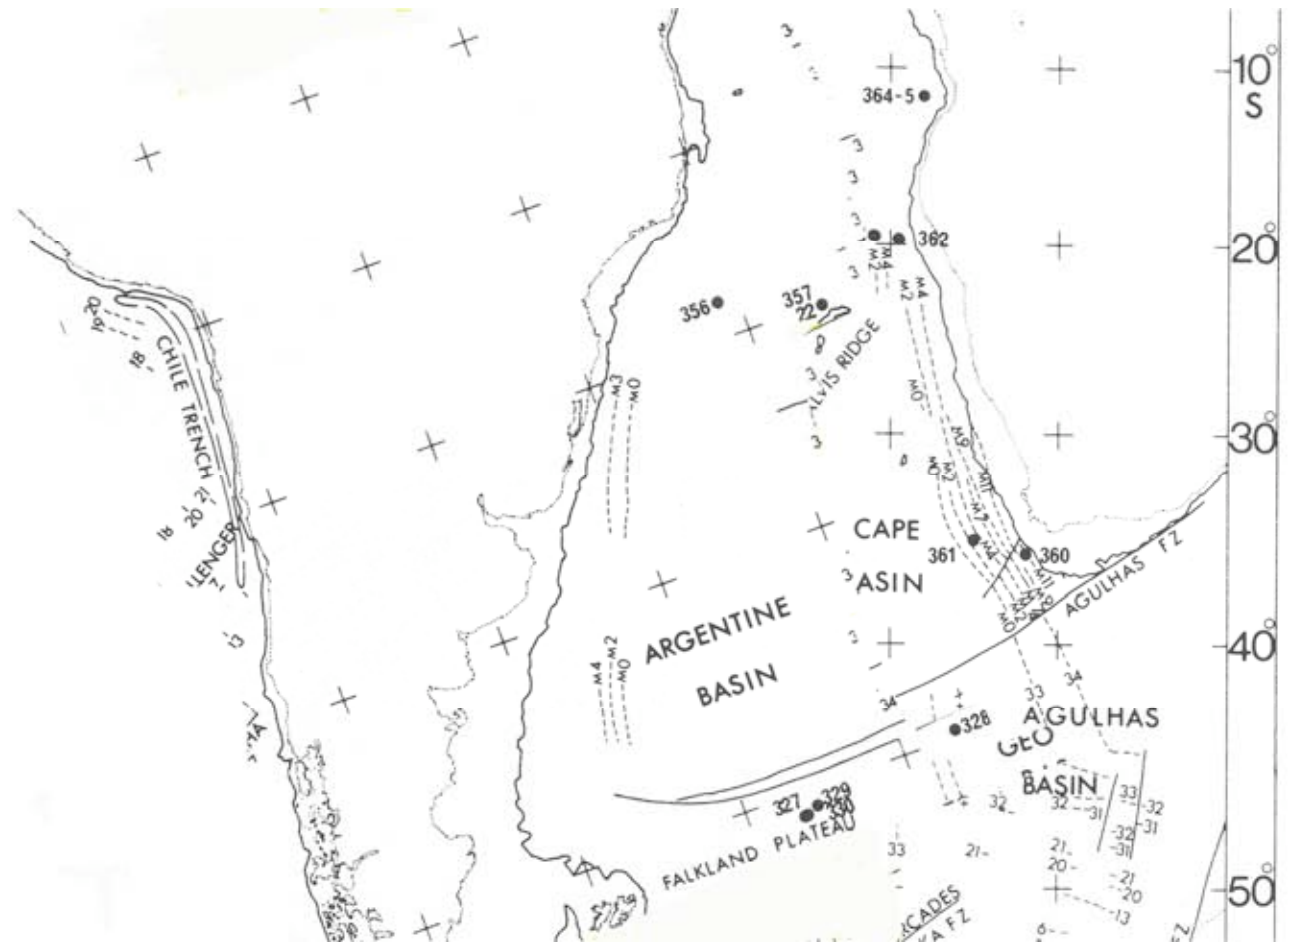

Anomaly 21 (50 Ma) reconstruction

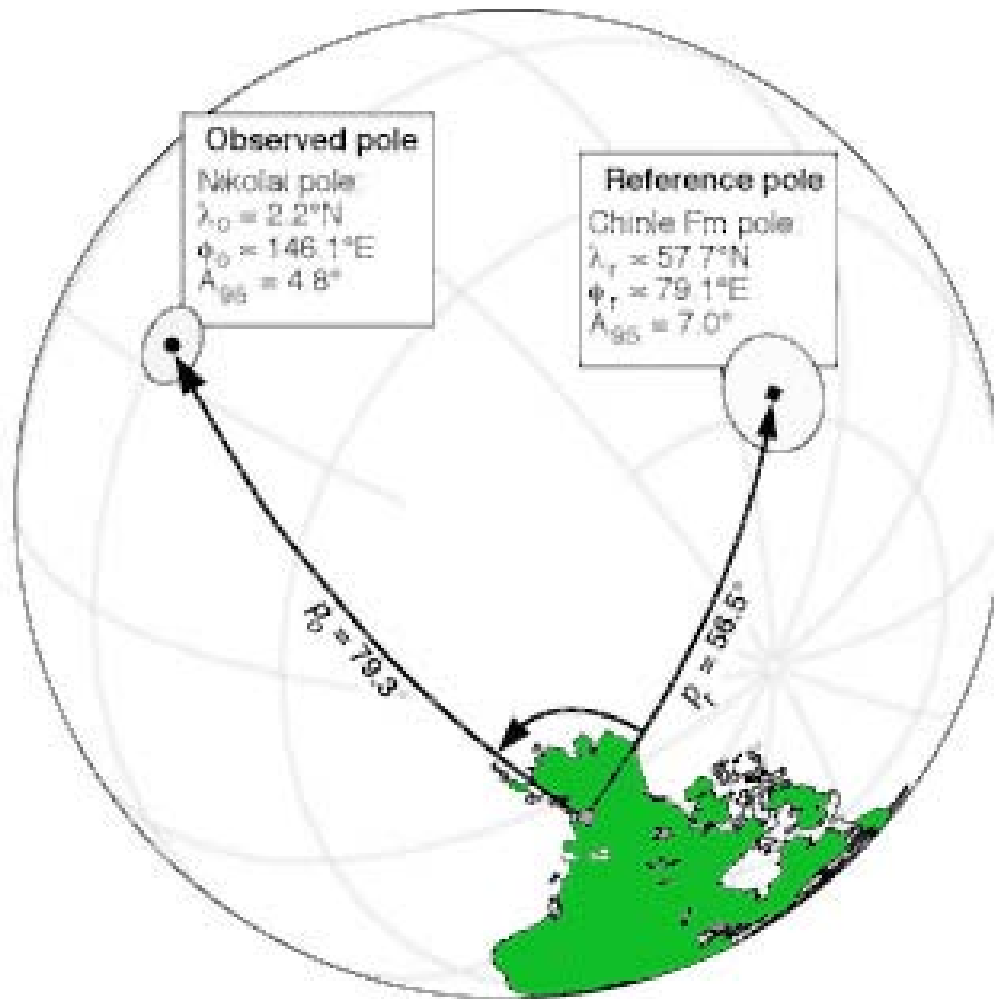

Sea floor younger than anomaly 34 (< 90 Ma)

Anomaly 34 (90 Ma) reconstruction

Apparent magnetic pole position

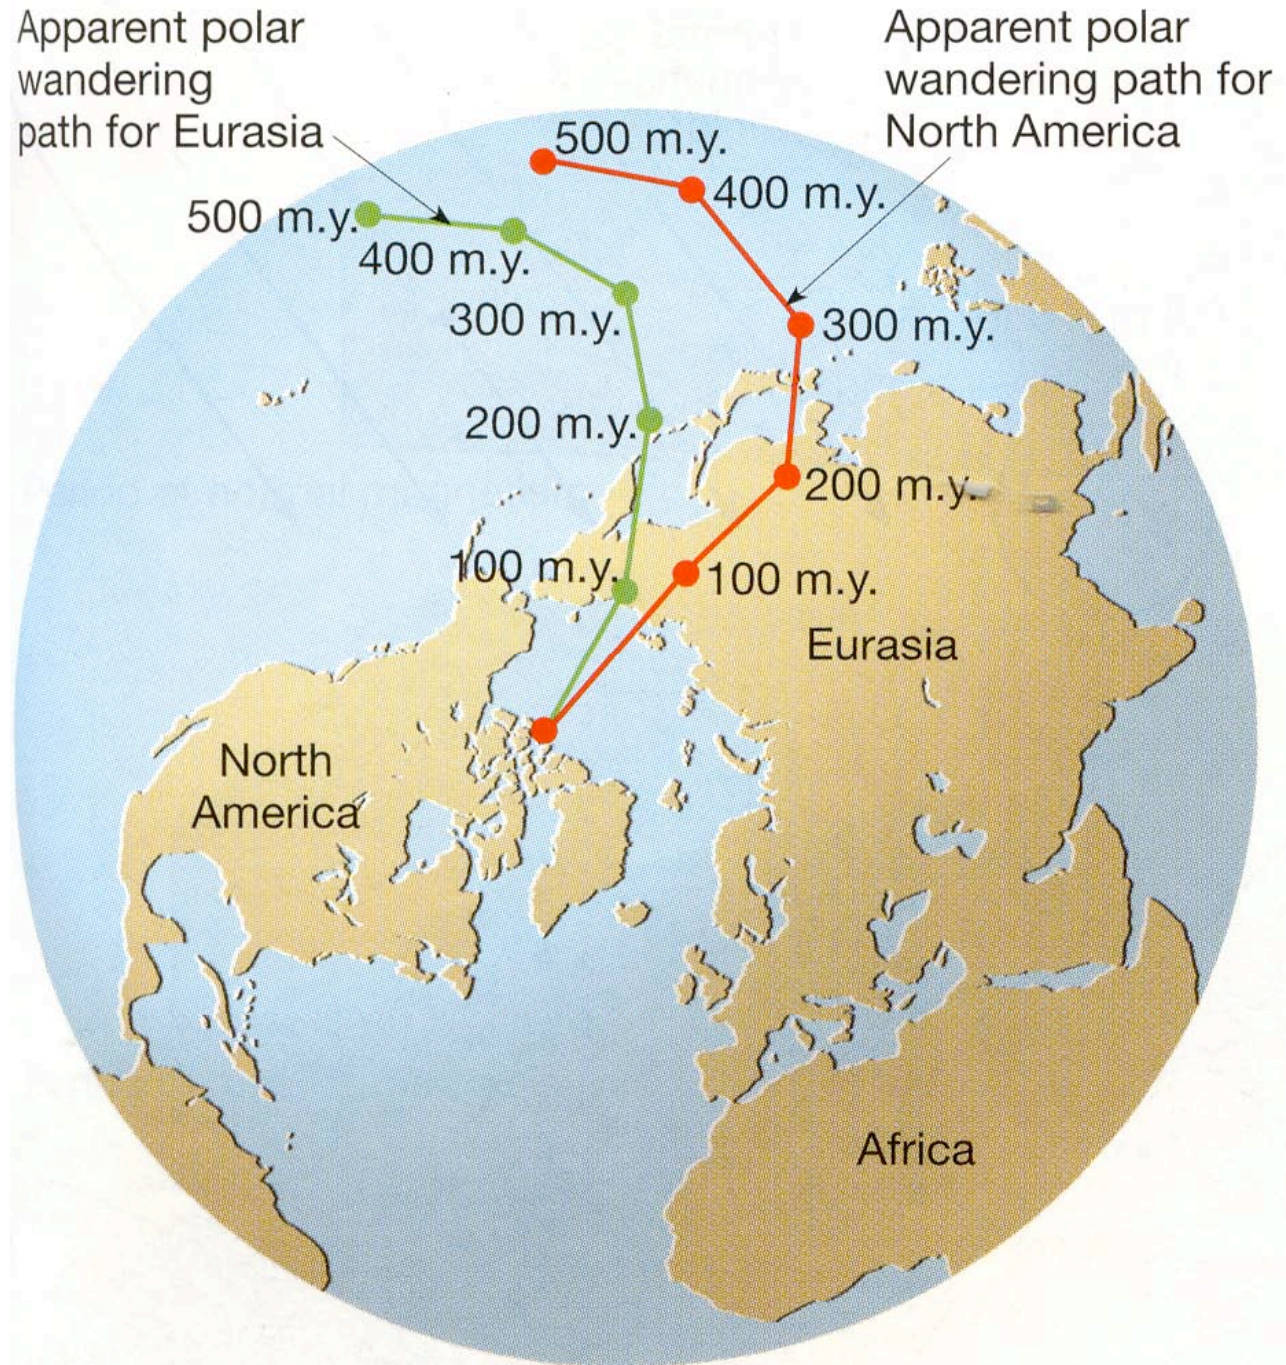

Paleomagnetic-

Inclination: distance from the magnetic pole.
Steep inclination means short distance

Declination: direction towards the pole

**Apparent polar wander:
Apparent pole positions from rocks of different ages**

**Plate reconstruction
FROM apparent
polar wander
curves.**

**For a viable
reconstruction,
APW curves MUST
point towards a
common pole**

Apparent polar wandering path for Eurasia

Apparent polar wandering path for North America
